

APP BERTELLI&PARTNERS REMOTE CONTROLLER

Everybody longs for a fast service capable to fix effectively any issue

Remote servicing is the solution that the end user has been waiting for years.

Now it is possible to interact with a gas boiler over internet through a User-friendly App; for a preventive diagnostic oriented to a smart intervention on site or, sometimes, even to fix an issue remotely.

It also allows the end user to improve comfort and reduce gas consumption, supporting a responsible attitude towards environment.

Moreover the boiler manufacturer can directly monitor and control the installations, collect information for statistics or perform accurate analysis in real time.

With the evolution of self-diagnostic and system report capabilities (Active Combustion Control), as well as the widespread of bus communication (All for one, one for all), the App can operate within the whole heating plant enhancing functionalities for combustion and heating system optimization.
